

133 Series Self-Operated Regulators

Features

- **Wide Pressure Range Capability with Single Regulator**—Type 133H may also use Type 133L springs, allowing pressure settings to be varied between 2-inches w.c. and 10 psig (5 mbar and 0,69 bar) by changing springs.
- **Types 133L, 133H and 133HP Suitable for Monitoring Applications**—O-ring stem seal on Types 133L, 133H and 133HP isolates body pressure from controlled pressure.
- **Excellent Shock Characteristics and Fast Speed of Response**—Due to two-way stabilizer vent valve, which vents the spring case more rapidly than conventional vents, lag in diaphragm and valve disk movement is minimized.
- **Bubble-Tight Shutoff**—Single-port construction, large diaphragm area, and light-rate springs along with disk material and seat design provide low lock-up pressures.
- **Spring and Diaphragm Effects Minimized** boosting system provides excellent performance over a wide range of flow conditions.
- **No Seat-to-Seat Adjustment Required**—Balanced single-port design eliminates necessity for seat-to seat adjustments to achieve bubble tight shutoff.
- **Easy Access to Trim Parts**—Valve seat, disk, and cage easily removed with body remaining in line and without disassembly of actuator portion; orifice is not threaded in.
- **Reusable Pressure Seals**—O-rings used for pressure seals, unlike gaskets, are not ordinarily damaged by disassembling the regulator.
- **Resistance to Piping Stresses**—Steel constructions are available to help resist pipe stresses.

Bulletin 71.1:133

Specifications

Available Configurations

Type 133H: Self-operated regulator for inlet pressures to 60 psig (4,14 bar) and outlet pressures from 1.5 to 10 psig (0,10 to 0,69 bar), three ranges

Type 133HP: Self-operated regulator for inlet pressures to 150 psig (10,3 bar) and outlet pressures from 2 to 60 psig (0,14 to 4,14 bar), seven ranges

Type 133L: Self-operated regulator for inlet pressures to 60 psig (4,14 bar) and outlet pressures from 2-inches w.c. to 2 psig (5 mbar to 0,14 bar), six ranges

Type 133Z Zero Governor: Self-operated regulator for inlet pressures to 20 psig (1,38 bar) and outlet pressures from -1 to 4-inches w.c. (-2,5 to 10 mbar), two ranges

End Connections

2-inch (DN 50) Cast iron NPT female, cast iron ANSI Class 125 flat-face flanged, steel NPT female or steel ANSI Class 150 raised-face flanged

Maximum Inlet Pressures⁽¹⁾

See Table 2

Outlet Pressure Ranges⁽¹⁾

Maximum Outlet Pressures⁽¹⁾

See Table 2

Pressure Registration

External; downstream control line is required

Control Line Connection

Types 133H, 133L and 133Z: 3/4-inch NPT female; connection will be positioned directly over body outlet (standard position) or 90° right or left of standard position if specified

Type 133HP: 1/4-inch NPT female connection positioned directly over body outlet

Vent Connection

Types 133H, 133L and 133Z: 1-inch NPT female with screen; standard position is in line with control line connection directly over body outlet. Vent will always be positioned over the control line connection.

Type 133HP: 1/2-inch NPT female connection positioned directly over body inlet with a Fisher Type Y602-7

Temperature Capabilities⁽¹⁾

Construction Materials

Body: Cast iron or Steel

Orifice and Cage: Aluminum

Valve Disk: Aluminum/neoprene

O-Rings: Nitrile

Diaphragms: Nitrile/nylon (neoprene in actuator)

Guide Bushing: Nylon

Stem and Stem Sleeve: Stainless steel

Diaphragm Plate: Steel

Balancing Diaphragm Plate: Plated steel

Spring Case

Type 133HP: Cast Iron

Types 133H, 133L and 133Z: Aluminum

Lower Casing: Aluminum

Closing Cap: Cast iron

Adjusting Screw: Steel

Optional Restriction Collar: Aluminum

Approximate Shipping Weight

Types 133H, 133L and 133Z NPT

End Connections: 35 pounds (15,88 kg)

Types 133H, 133L and 133Z Flanged

End Connections: 40 pounds (18,14 kg)

Type 133HP NPT End Connections:

56.5 pounds (25,63 kg)

Type 133HP Flanged End Connections:

62.5 pounds (28,35 kg)

Option

Restriction collar to reduce wide-open capacity to approximately 25%, 40%, or 60% of standard wide-open capacity

1. None of the pressure/temperature limits in this bulletin, nor any applicable standard limitation, should be exceeded.

2. Using optional restriction collar.

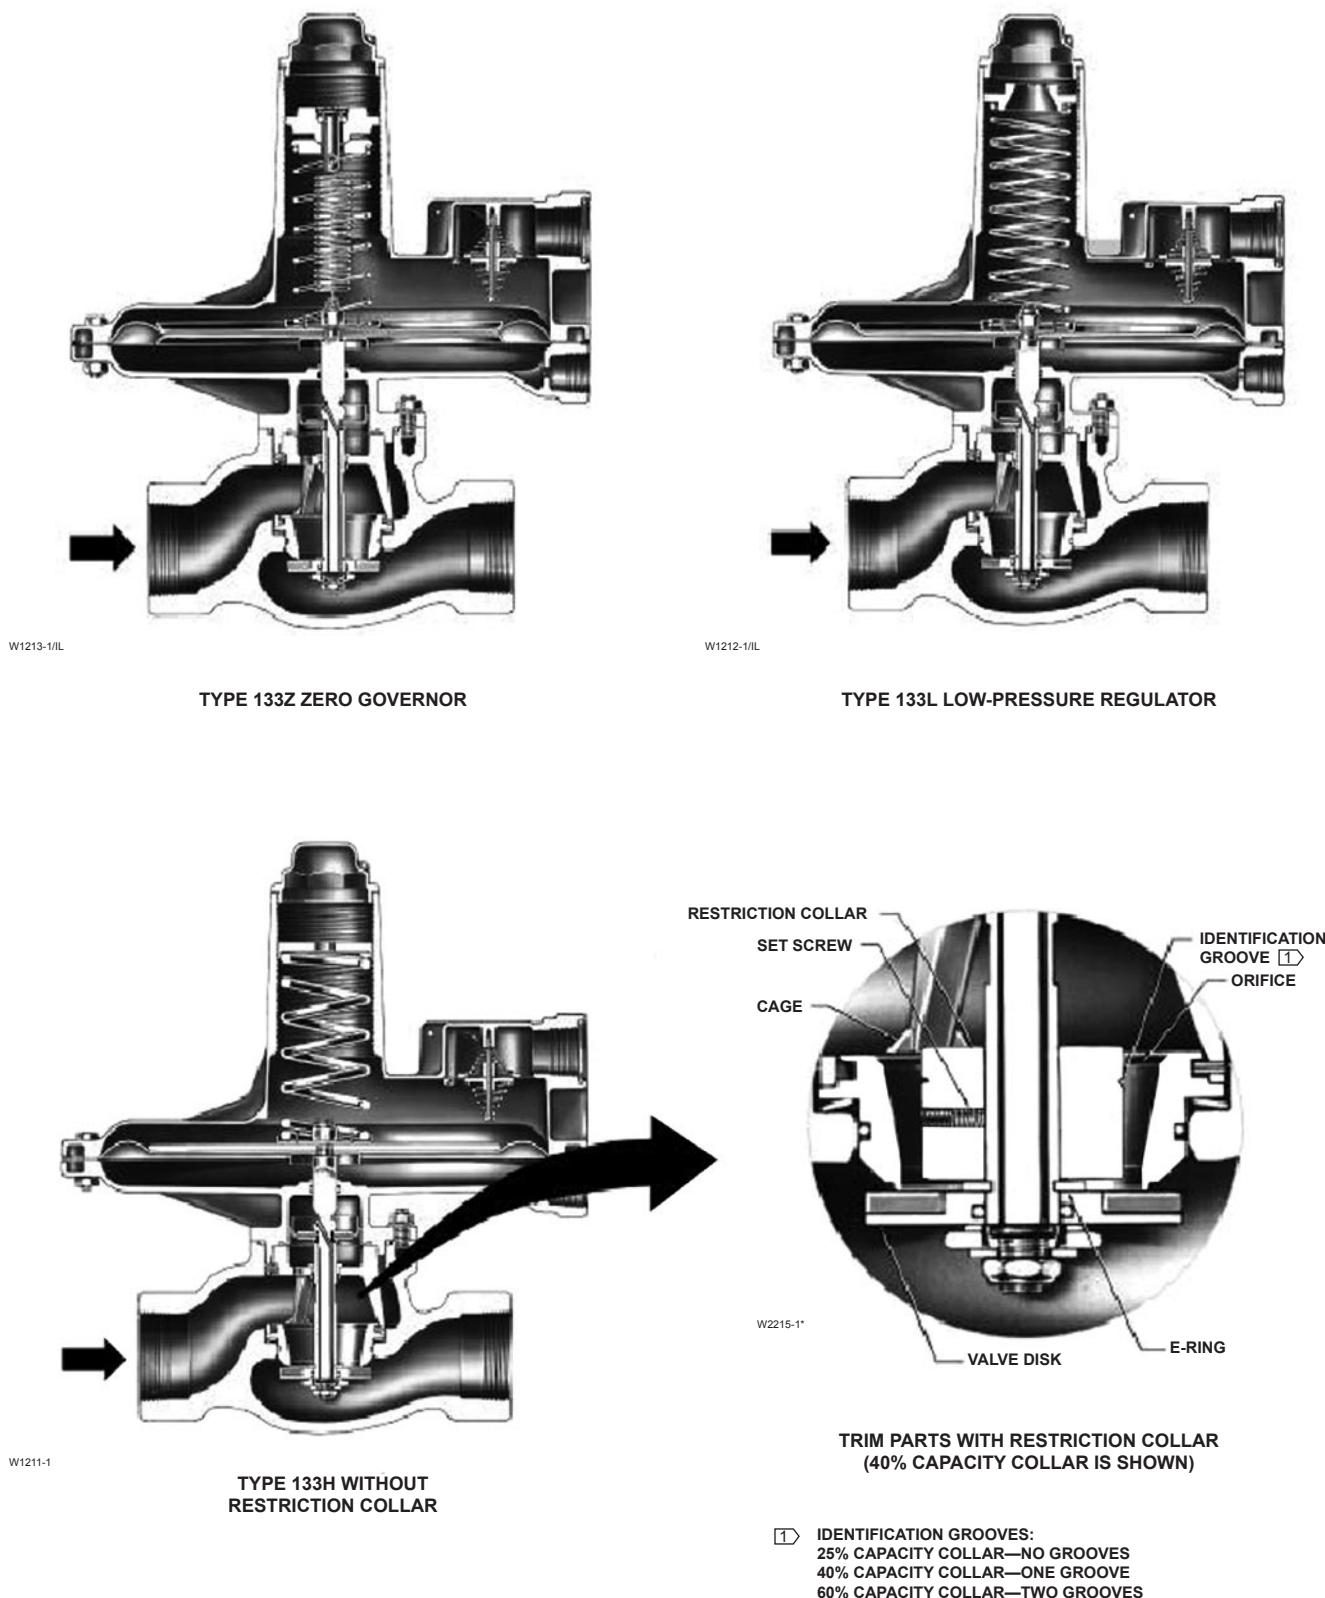

Figure 2. Types 133Z, 133L and 133H Regulators

Introduction

Description

The 133 Series self-operated gas regulators, shown on the cover are primarily designed for industrial and commercial applications supplying gas to furnaces, burners and other appliances. The 133 Series balancing system enables the regulator to provide accurate control of gas pressure for maximum combustion efficiency despite varying inlet pressure conditions. The single port construction provides bubble tight shutoff. An external downstream control line is required for the operation of the regulator. Refer to Table 1 for outlet pressure ranges of each type. 133 Series regulators are available in a 2-inch (DN 50) body size with either threaded NPT or flanged end connections.

An optional restriction collar (Figure 2) can be installed if wide-open capacity is too high for applications using a relief valve as overpressure protection. The collar reduces wide-open capacity to 25, 40, or 60% of standard wide-open capacity.

Type 133H—High pressure construction for outlet pressure range of 1.5 to 10 psig (0,10 to 0,69 bar). The Type 133H can also use the 2-inches w.c. to 2 psig (5 mbar to 0,14 bar) springs of the Type 133L. The maximum operating inlet pressure is 60 psig (4,14 bar) with a maximum emergency inlet pressure of 125 psig (8,62 bar).

Type 133HP—Extra high pressure construction for outlet pressure range of 2 to 60 psig (0,14 to 4,14 bar). The maximum inlet pressure rating is 150 psig (10,3 bar).

Type 133L—Low pressure construction for outlet pressure range of 2-inches w.c. to 2 psig (5 mbar to 0,14 bar). The maximum operating inlet pressure is 60 psig (4,14 bar) with a maximum emergency inlet pressure of 125 psig (8,62 bar).

Type 133Z—Zero governor construction for outlet pressure range of -1 to 4-inches w.c. (-2,5 to 10 mbar). The maximum operating inlet pressure is 20 psig (1,38 bar) with a maximum emergency inlet pressure of 125 psig (8,62 bar).

Principle of Operation

Refer to the operational schematics in Figure 4. In the 133 Series, downstream pressure is registered under the diaphragm via the external control line and is used as the operating medium. Increased demand lowers the downstream pressure and allows the spring to move the diaphragm and stem assembly down, opening the valve disk and supplying more gas to the

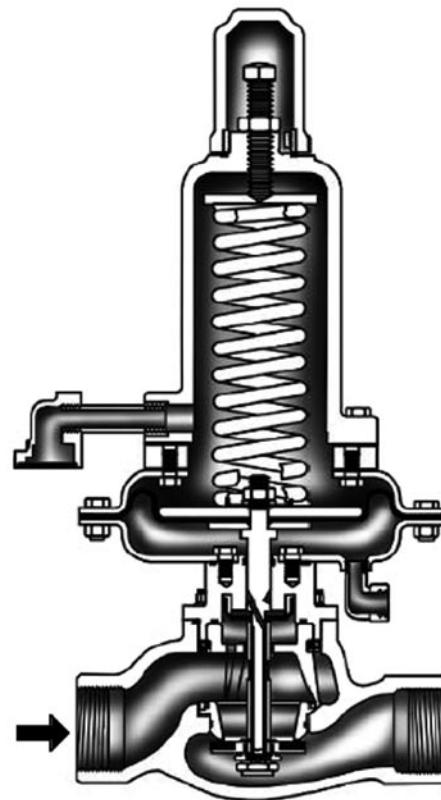

Figure 3. Type 133HP Regulator

downstream system. Decreased demand increases the downstream pressure and moves the diaphragm and stem assembly up, closing the valve disk and decreasing the gas supply to the downstream system.

Boosting System

The 133 Series incorporates a balancing diaphragm and a boosting system. When the regulator is locked up, inlet pressure is registered on the top of the valve disk and on the bottom of the balancing diaphragm through registration holes in the top of the cage. Also, downstream pressure is registered on the bottom of the valve disk and on the top of the balancing diaphragm through a passage formed by grooves in the registration disk and an annular space between the stem and stem sleeve.

When the valve disk is open, gas flows from the inlet over the edge of the valve disk to the outlet. Under the valve disk near the registration disk, there is little gas flow. The gas pressure near the registration disk is higher than it is in the flow path where gas velocity tends to lower the pressure. The higher pressure near the disk is registered on the top of the balancing diaphragm through the registration disk and the annular space between the stem and stem sleeve.

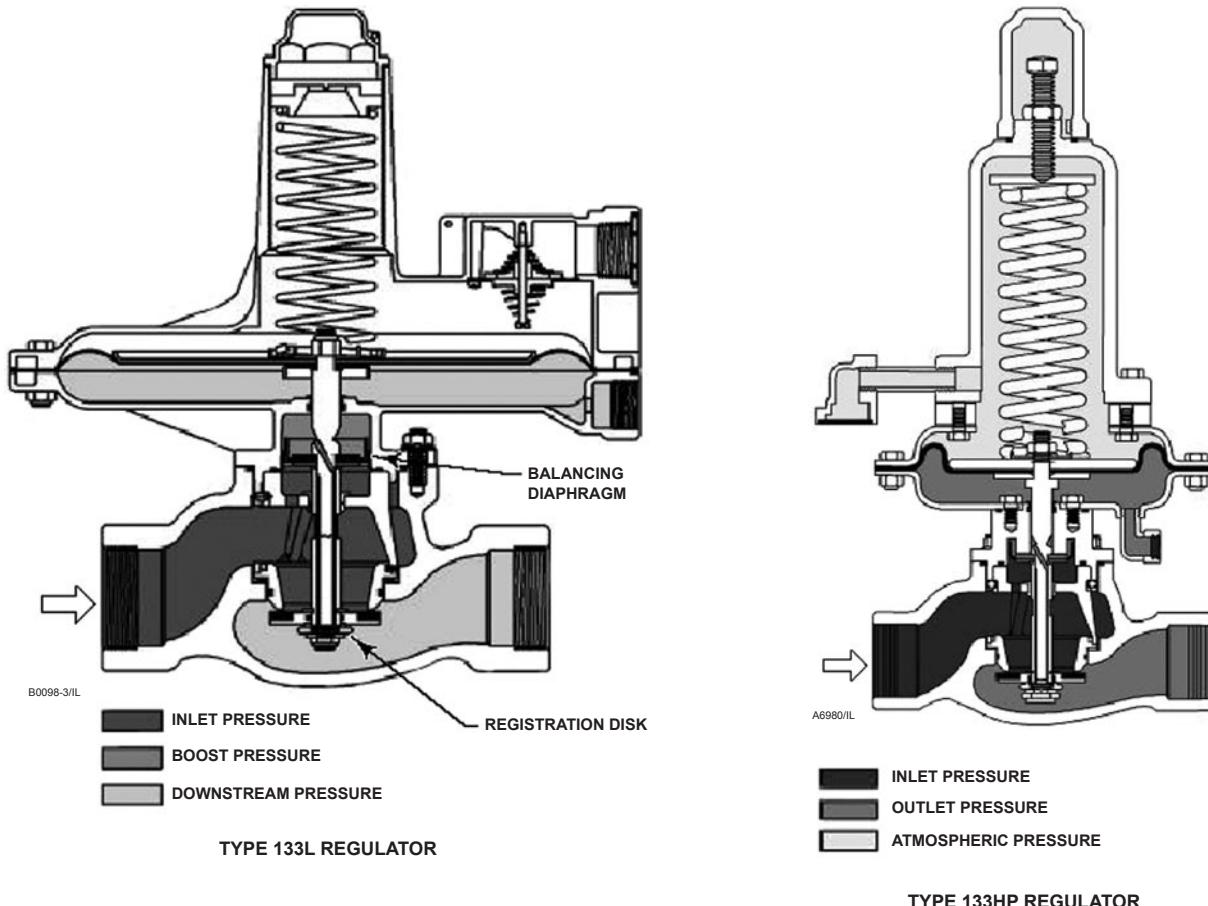

Figure 4. Operational Schematics

This pressure registered on the top of the balancing diaphragm aids downward disk travel and compensates for spring and diaphragm effect. This improves regulator rangeability and performance.

Two-Way Stabilizer Vent Valve on Types 133H, 133L and 133Z

When the regulator responds to an increase in downstream pressure, the diaphragm moves upward. As the diaphragm rises, movement of air forces the lower vent flapper upward, carrying the upper flapper with it (see Figure 5). This allows the air above the diaphragm to vent to atmosphere rapidly enough to minimize lag in diaphragm movement.

As the diaphragm falls, air rushes in the vent to fill the partial vacuum created, forcing the upper vent flapper against the orifice plate. Air flowing through the webs of the upper flapper opens the lower flapper (see Figure 5). With the regulator at steady-state conditions, both flappers are closed and only a small hole is open to help stabilize normal operation.

Overpressure Protection

As is the case with most regulators, the 133 Series regulators have outlet pressure ratings that are lower than the inlet pressure ratings. Some type of Overpressure Protection is needed if the actual inlet pressure ever exceeds the outlet pressure rating.

Maximum inlet and outlet pressures for the 133 Series are given in Table 2. All models must be protected against inlet pressure above the maximum emergency inlet pressure (refer to Table 2).

Outlet pressure more than 3 psig (0,21 bar) or 40 psig (2,76 bar) for Type 133HP over the outlet pressure setting of the regulator may damage internal parts such as the diaphragm plate and valve disk.

Regulator operation below these emergency pressure limitations does not preclude the possibility of damage from external sources or from debris in the gas line. The regulator should be inspected for damage after any overpressure condition. Complete instructions for installation, operation, and maintenance are provided with each regulator.

Bulletin 71.1:133

1. Pressure ranges shown are correct if the regulator is installed with the actuator portion above the body portion. If the regulator is installed with the actuator portion below the body, the pressure ranges will be lowered by approximately 2-inches w.c. (5 mbar) for the Type 133L and by approximately 3-inches w.c. (7 mbar) for the Types 133H and 133Z.
 2. If the 2-inches w.c. (5 mbar) to 2 psig (0.14 bar) springs (all 6 ranges) are used in the Type 133H, the pressure ranges will increase by approximately 1-inch w.c. (2 mbar) due to the weight of the Type 133H parts (assuming that the actuator is installed above the body).

Table 2. Maximum Inlet and Outlet Pressures

1. With highest spring range available only.

Capacity Data

Flow capacities for various inlet pressures and outlet pressure settings are shown in Tables 3 to 10. Capacities for Tables 3 to 10 are in thousands of cubic feet per hour of 0.6 specific gravity gas at 60°F and 14.7 psia. To convert to equivalent capacities of other gases, multiply the values shown by the appropriate factor: air-0.775; propane-0.628, butane-0.548; nitrogen-0.789.

Note

For optimum performance, select the lowest spring range that includes the desired outlet pressure setting.

For restricted-capacity constructions, determine flow capacities for outlet pressure settings of 2 psig (0.14 bar) or less by multiplying the values from Tables 3 to 10 by 25, 40, or 60% (depending upon which restriction collar is selected). For pressure settings over 2 psig (0.14 bar), capacities are given in Table 6. If flow capacities for inlet pressures lower than those shown are required, contact the Sales Representative. The representative regulating C_g of 1650 may be used for regulator sizing of full-capacity constructions only if capacity table data is not available. The representative regulating C_g is an approximation only for pressure drops greater than 5 psi (0.34 bar), because, at a given offset in controlled pressure, the regulating C_g varies with the spring being used with the pressure drop across the valve.

Figure 5. Types 133H, 133L and 133Z Stabilizer Vent

To determine capacity using the flow coefficient C_g , use the appropriate procedure below.

1. If flow is critical (absolute outlet pressure is equal to or less than one-half the absolute inlet pressure), use the equation:

$$\text{Capacity} = (\text{Absolute Inlet Pressure}) (C_g) (1.29)$$

The capacity determined will be in standard cubic feet per hour of 0.6 specific gravity gas.

2. If flow is less than critical (absolute outlet pressure is greater than one-half the absolute inlet pressure), use the Fisher sizing slide rule or the sizing nomographs in Fisher Catalog 10 to determine capacity.

Table 3. Full-Capacity Type 133Z Regulated Flow in Thousands of SCFH of (0.6 Specific Gravity Gas at 14.7 Psia and 60°F)

INLET PRESSURE	1-INCH W.C. (2,5 mbar) OUTLET PRESSURE SETTING ⁽¹⁾ (EITHER SPRING RANGE)	
	0.5-inch w.c. (1 mbar) Droop SCFH (Nm ³ /h)	1-inch w.c. (2,5 mbar) Droop SCFH (Nm ³ /h)
8-inches w.c. (20 mbar)	2.4 (0,06)	5.1 (0,14)
14-inches w.c. (35 mbar)	4.1 (0,11)	7.4 (0,20)
1 psig (0,07 bar)	6.5 (0,17)	12 (0,32)
2 psig (0,14 bar)	11.5 (0,31)	18 (0,48)
5 psig (0,34 bar)	22 (0,59)	32 (0,86)
10 psig (0,69 bar)	44 (1,18)	50 (1,34)
20 psig (1,38 bar)	76 (2,04)	78 (2,09)

1. Outlet pressure setting was made at approximately 10% of the maximum capacity for the listed conditions.

Installation

The regulator may be installed in any position but is normally installed with the actuator portion vertical above the body portion. Flow through the body must be in the direction indicated by the flow direction arrow cast on the body portion. A downstream control line is required for operation of the regulator.

A remote vent line may be required for some installations. Vent openings must be protected against the entrance of rain, snow, insects, or any other foreign material that may plug the vent.

External dimensions are shown in Figure 9.

Ordering Information

When ordering, specify:

Application

1. Type of gas being controlled (natural gas, air, etc.): list any factors such as impurities in the gas that may affect compatibility of the gas with the regulator trim parts.
2. Specific gravity of the gas
3. Temperature of the gas
4. Range of flowing inlet pressures to regulator
5. Outlet pressure
6. Flow rates
 - a) Minimum controlled flow
 - b) Normal flow
 - c) Maximum flow
7. Line size and end connection size of adjacent piping

Regulator

Refer to the Specifications section on page 2. Carefully review the description to the right of each specification and in the referenced tables. Specify the desired selection wherever there is a choice to be made. Always specify the regulator type number.

Bulletin 71.1:133

			60	4,14	80.5 (2,16)	109.1 (2,92)	109.2 (2,93)

1. Outlet pressure setting was made at approximately 10% of the maximum capacity for the listed conditions.
2. Shaded area is equal to maximum flow capacity.
